Gate Automation Guide

Here at our factory in Rosebud, Woodville Constructions custom make and install gates suitable for automation. Whether swing, roller or cantilever, we have the solution for your gate requirements.

Our gates are made from a large range of materials including aluminium, hot dipped galvanised steel, stainless steel and timber to name a few. Designs are endless and limited only to imagination.

Automation is specifically designed to suit each gate, taking into account the size of the gate, weight, opening, wind loading and power source intended. Both mains powered and solar powered options are available.

When selecting gate automation it is important to consider battery back-up (in the mains powered options, in case of power failure).

Other important safety features are photocells which detect any obstructions in the gate's pathway (eg parked cars, children and pets etc.) and will automatically stop the gate from closing and return it to the open position.

Other useful items include digital entry keypads (coded for entry instead of carrying remotes), safety flashing light (indicating gate is in use), extended aerial for longer remote range and key entry (instead of carrying remote when on foot).

Woodville Constructions will tailor automation of your gate to your requirements from consultation to design through to construction.

We use only the highest quality motors and equipment available on the market, giving peace of mind for a long service life as well as back-up service.

Drop into our factory display (14 Jennings Court Rosebud) to see our working model (roller gate – with all features) and try for yourself.

We also sell D.I.Y Kits to trade and public (see price list Gate Automation and Accessories). Furthermore we can design your gate to be automated in the future.
